Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
for identifying a gene or genes associated with a selected phenotype such as the one related to cancer, nephritis, prostate hypertrophy, hematopoiesis; osteoporosis, obesity, cardiovascular disease or diabetes. The method is useful in academic laboratories, in the biotechnological industries, and in pharmaceutical, genomic, agricultural and chemical companies. AAB84233.44 represent recognition helices of zinc finger proteins, which recognise different DNA triplets.
gene of interest, in cells exhibiting the phenotype. The method is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    phenotype
                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Case CC,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                              The invention relates to a method of screening a compound for interaction with a molecular target. The method involves contacting first and second cells with the compound and determining the values of properties of the compound. The second-cell comprises an exogenous zinc finger protein (ZPP) that modulates the expression of the molecular target, or isolating membranes from cell comprising SPP. The methods allow for high throughput screening of candidate compound and reduces the incidence of false positives. The methods are useful for screening a compound for interaction with a molecular target or for screening a compound for its effect on a cellular process. The method is useful for testing a compound for its capacity to transduce a signal to the molecular target or its and for performing blochemical drug-screening assays. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes a method for identifying genes associated with a selected phenotype. The method involves providing a library of nucleotide sequences encoding partially randomized zinc finger proteins, transducing cells with expression vectors, each comprising a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying genes associated with selected phenotype for research purposes, involves culturing cells transduced with nucleic acid encoding zinc finger proteins and assaying cells exhibiting selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phenotype associated gene; zinc finger protein; cancer; nephritis; prostate hypertrophy; hematopoiesis; osteoporosis; obesity; cardiovascular disease; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zinc protein recognition helix SBS3 for target DNA triplet GGG.

The method involves providing a library of microstide sequences encoding partially randomized zinc finger proteins, transducing cells with expression vectors, each comprising a sequence from the library, culturing the cells for expressing the zinc finger protein, assaying the cells for selected phenotype, and identifying the perotein, assaying the cells for selected phenotype, and identifying the for identifying a gene of interest, in cells exhibiting the phenotype. The method is useful for identifying a gene or genes associated with a selected phenotype such as the one related to cancer, nephritis, prostate hypertrophy. The method is useful in academic laboratories, in the biotechnological industries, and in pharmaceutical, genomic, agricultural and chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method for identifying genes associated

The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VBGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atheroscierosis, ischiaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatheroscierotic; vasotropic; antiathritic; vulneran antiulcer; cytostatic; antipsoriatic; antidiabetic; ophthalmological; osteopathic; antiinfertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diabetic retinopathy; psoríasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiarthritic; vulnera; antiulcer; cytostatic; antionipsoriatic; antidiabetic; ophthalmological; osteopathic; antilinfertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of gene and for treating atherosclerosis, ischemia, arthritis, wound or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human VEGF-targeted zinc finger protein fragment SEQ ID NO: 68

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a modified plant zinc finger protein. This zinc finger protein is used to modulated gene expression in a plant cell. Nucleic acid encoding the zinc finger is expressed in plant cells to produce a plant with an altered phenotype relative to the wild-type plant. The altered phenotype is high in nutritional value, yield, stress tolerance, pathogen resistance, resistance to agrochemicals, production of pharmaceutical compounds or production of industrial chemicals. The present sequence is a zinc finger protein sequence that is attracted to a ZFP target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified plant zinc finger protein for modulating gene expression in plant cell comprises zinc fingers that bind to a target site -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                               The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                The present invention relates to a zinc finger protein that binds to a target site in one or more vasular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or
New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of t gene and for treating atherosclerosis, ischemia, arthritis, wound or

The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating anglogenesis and vasculogenesis. This can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                               diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiarthritic; vulnera antiulcer; cytostatic; antiatissoriatic; antidiabetic; ophthalmological; osteopathic; antiinfertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diabetic retinopathy, psoriasis, arthropathy; cancer, tumour growth, gene therapy, antiatherosclerotic, vasotropic, antiarthritic, vulnera) antiulcer; cytostatic, antipsoriatic, antidiabetic, ophthalmological,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of tgene and for treating atherosclerosis, ischemia, arthritis, wound or

                                                    linc finger protein; angiogenesis; vasculogenesis; ischaemia; diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiarthritic; vulnerary; anticler; cytostatic; antipsoriatic; antidiabetic; ophthalmological; osteopathic; antilnfertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Zinc finger protein; angiogenesis; vasculogenesis; ischaemia; diabetic retinopathy; psoriasis; arthropathy; cancer; tumour growth; gene therapy; antiatherosclerotic; vasotropic; antiarthritic; vulnerary; antilocer; cytostatic; antipsoriatic; antidiabetic; ophthalmological; osteopathic; antiinfertility.
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, uicers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                 New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or ulcer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human VEGF-targeted zinc finger protein fragment SEQ ID NO: 105.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                  New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of t gene and for treating atherosclerosis, ischemia, arthritis, wound or

```

The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used trreat atheroscierosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.

The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, dilabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the

-! FUNCTION: SINGLE STRANDED DNA-BINDING PROFEIN, WITH SPECIFICITY TO THE STEROL REGULATORY ELEMENT (SRE). CNBP IS INVOLVED IN STEROL-MEDIATED REPRESSION (BY SIMILARITY).

-! SUBCELLULAR LOCATION: CYTOPLASMIC, ALSO PRESENT IN ENDOPLASMIC RETICCULUM (BY SIMILARITY).

-! SIMILARITY: TO S.POMBE BYR3 AND TO RETROVIRAL NUCLEIC ACID BINDING PROFEINS (NBP).

                                                                                                                                                                                                                    "Transcriptional regulation of the AP-2alpha promoter by BTEB-1 and AP-2rep, a novel wt-1/egr-related zinc finger repressor.";
Mol. Cell. Biol. 19:194-204(1999).

-i- FUNCTION: TRANSCRIPTION FACTOR THAT BINDS TO GC BOX PROMOTER ELEMENTS. SELECTIVELY ACTIVATES MRNA SYNTHESIS FROM GENES CONTAINING TANDEM REPEATS OF GC BOXES BUT REPRESSES GENES WITH A SINGLE GC BOX.

-i- SUBCELLULAR LOCATION: Nuclear.
                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
